TABLE PITCH · 60 SECONDS · THEN 60 SECONDS OF QUESTIONS

FLOODS ARE PREDICTABLE. RESPONSE SHOULDN'T BE THE PART THAT ISN'T.

At a table, the judge is a foot from your screen. Skip the setup and put the product in their face within 15 seconds. One narrator, three demo moves, one hard stop.

Hook	The loop	Wow: what-if	Report + respond	Voice	Close
0:00–0:08	0:08–0:15	0:15–0:30	0:30–0:42	0:42–0:52	0:52–1:00

Gold bold = say it word for word (about 120 words total, so it fits with the demo actions). *[Gray brackets]* = what happens on screen or at the table. Green = filled in from our code and data (every number is on screen in the app). Yellow = still to fill in.

01 · THE 60-SECOND SCRIPT

0:00–1:00

HOOK HAMZAH 0:00–0:08	*[Laptop already open on Flood Command, angled at the judge.]* **"During Ida, Route 18 went underwater a mile from here. In a flood, the first thing that breaks isn't the roads. It's information."**
THE LOOP HAMZAH 0:08–0:15	**"So we built one loop: predict, detect, report, respond. A student app and a coordinator dashboard."**
WOW HAMZAH 0:15–0:30	**"This is the Raritan, live. Watch what happens if it rises three feet."** *[Drag the what-if slider slowly. Roads turn red.]* **"Every red road is one our model expects underwater. On Ida, a storm it never trained on, it warned of all 76 flooded roads about five hours early."**
REPORT HASSAN 0:30–0:36	*[Hold the phone toward the judge. Tap report, photo, send.]* **"A student sees water. One photo, sent."**
RESPOND HAMZAH 0:36–0:42	**"It lands here instantly, and our sensor** *[sensor lead]* *lifts the hardware]* **confirms it. One tap signals the nearest unit."**
VOICE HAMZAH 0:42–0:52	**"And if she can't read a map —"** *[Play voice guidance out loud from the phone. Let 3 seconds run.]* **"— it walks her to safety."**
CLOSE HAMZAH 0:52–1:00	**"Predict, detect, report, respond. One system for the people at risk and the people helping them."** *[Stop. Make eye contact. Let them ask.]*

If the judge is rushed: 30-second version (hook, slider, close)
"During Ida, Route 18 flooded a mile from here, and the first thing that broke was information. We predict, detect, report and respond in one system." *[Drag slider.]* **"That's the live Raritan rising three feet. On Ida's data we warned of all 76 flooded roads, about five hours early. Students report, our sensor confirms, coordinators dispatch."**

02 · 60-SECOND Q&A

~10 sec per answer

Sixty seconds is three or four questions. One sentence plus one detail, then stop. Whoever owns the topic answers; nobody else adds on. If you don't know, say what you'd do to find out.

Q1 HAMZAH	**Does the model actually work?** Trained on 15 years of hourly readings from 7 USGS river gauges, plus rain at Somerset Airport; on Ida, which it never saw, it warned of all 76 roads that flooded, 5 hours early on median (up to 9). Next step is validating on more storms.
Q2 HAMZAH	**What's real vs. mocked?** Real: the live river gauge, NOAA radar rain, our ML forecast, USGS river cameras, student photo reports with an AI check, the sensor, and walking routes. Simulated: dispatch records the decision but doesn't reach a real station yet; the what-if levels and the Ida replay are scenarios. Say it plainly; don't wait to be caught.
Q3 [SENSOR LEAD]	**How does the sensor work?** ESP32 with an ultrasonic distance sensor pointed down at the road, about $15 a unit, reporting over Wi-Fi every 10 seconds. 15 cm of water closes the road to walking. Hand it to the judge.
Q4 HASSAN	**Why would students use it?** It's a link, not an app: no download, no account, one photo to report. It would go out through RU Alert, which already reaches every student, and blind students can use it entirely by voice.
Q5 HASSAN	**Privacy?** No accounts and no tracking. Routes are planned on your phone, so we never store where you are; a location is saved only when you send a flood report.
Q6 HAMZAH	**Who would adopt this?** University emergency management first, then towns on gauged rivers. One flood day costs more than the software.
Q7 ANY	**What would you build next?** Validate on more storms, wire real dispatch with an agency partner, add SMS for students without data.

03 · TABLE SETUP & RESET

between every judge

SCREEN	Laptop angled toward where judges stand, brightness max, Flood Command open, slider at zero.
PHONE	HackRU-26 open on the report screen, volume up, voice guidance cued. Hassan holds it.
HARDWARE	Sensor on the table, powered and reporting. Judges love touching hardware; let them.
RESET	After each judge: slider back to zero, clear the demo report, re-cue audio. Takes 15 seconds; assign one person.
BACKUP	A 45-second screen recording ready in another tab in case Wi-Fi drops.
REPS	Run the full 60 seconds 5+ times out loud with a timer, including the switches.
